Synthetic PDF: mixed / 1

Three pages | Letter | Created for the PDF Compression Lab

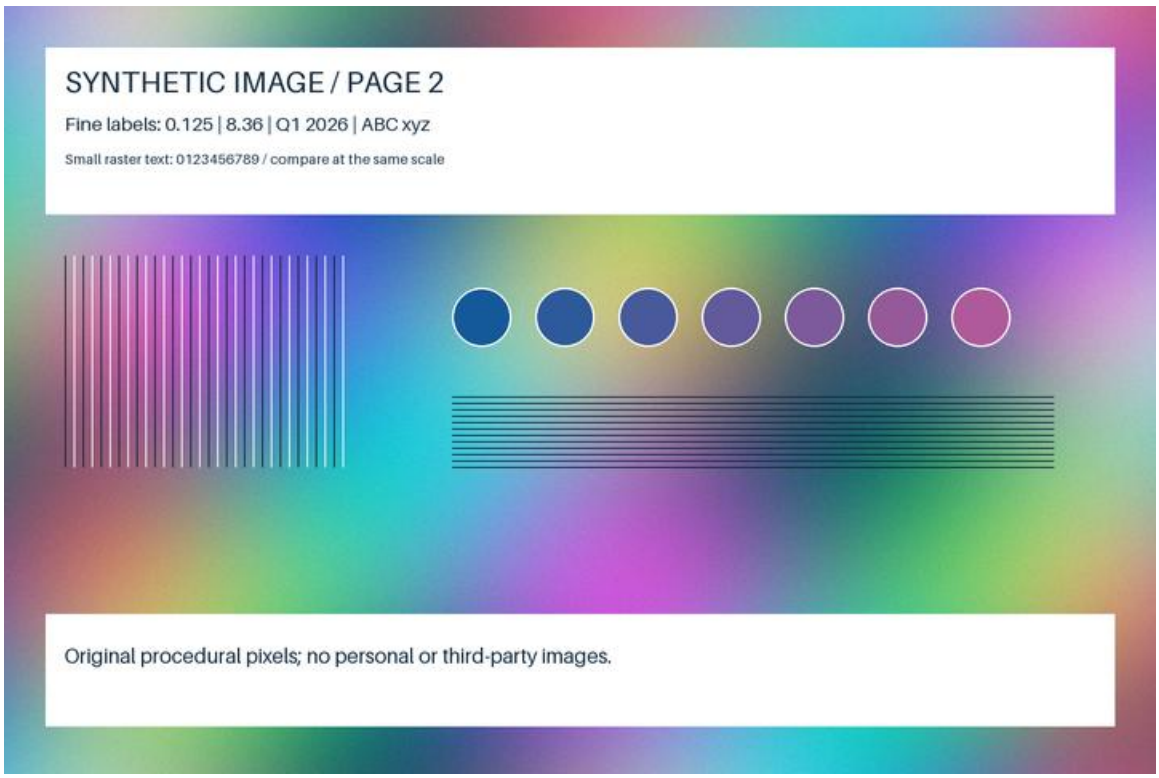

A PDF is a container for text, images, fonts, and drawing instructions.
Selectable text is stored as characters placed at coordinates on a page.
A photograph is stored as a grid of pixels with a particular encoding.
Reducing image resolution changes those pixels, not the page dimensions.
A smaller download is useful only when the important details remain readable.
Keep an original copy before changing a file that you plan to share.
Check small labels, thin rules, punctuation, and numerical values after export.
Text extraction is useful evidence but does not prove identical visual layout.
A three-file demonstration cannot predict the result for every PDF.
These pages contain synthetic material created only for this experiment.

Synthetic PDF: mixed / 2
